

ABSTRACT OF THE DISCLOSURE

A command control device is provided for enabling a user to specify or select an address through intuition and with one touch, instead of an address displayed in text form such as a complicated command string or bookmark, which cannot be selected intuitively. An information processing section includes an image capture section, a central processing section, and a command control section. The information processing section carries out a process according to a program stored in a program storage. The information processing section carries out the process first by receiving a user's instruction provided through an input section. Then, the information processing section makes an output section present image display corresponding to command control information stored in a command control information storage. Then, the information processing section executes a command that corresponds to the image display.
